

**Listing of Claims:**

Claims 1-7. (Cancelled)

8. (Currently Amended) A system for reconciling data in a plurality of databases, comprising:

a user interface; and

a plurality of databases coupled to the user interface;

~~adapted to provide wherein~~ a unique graphical representation of a record from each of the plurality of databases is presented on the user interface, and to allow for wherein the unique graphical representation of the record from each of the plurality of databases is interactively manipulatable on the user interface, interactive manipulation of the database records through the graphical representation and wherein a database operation is performable on a record in the database in response to an interactive manipulation of the unique graphical representation of the record on the user interface.

9. (Original) The system of Claim 8 wherein the graphical representation includes a visually distinctive graphical scheme for each of the plurality of databases, and a visually distinctive graphical scheme for each unique combination of the plurality of databases;

wherein a record found in a single database is displayed using the single database's corresponding graphical scheme; and

wherein a matching pair of records found in more than one database is displayed as a single record using the graphical scheme corresponding to the combination of databases.

10. (Original) The system of Claim 8 further comprising a communications link to each of the plurality of databases and wherein the user interface is adapted to

retrieve a record from each of the plurality of databases through its corresponding communications link.

11. (Currently Amended) The system of Claim 8 wherein the interactive ~~manipulations include~~ manipulation includes copying a record from a first database to a second database.
12. (Currently Amended) The system of Claim 8 wherein the interactive ~~manipulations further include~~ manipulation further includes deleting a record from at least one database.
13. (Original) The system of Claim 8 further comprising a temporary database table identifying a record found in more than one of the plurality of databases.
14. (Original) The system of Claim 8 wherein at least one of the plurality of databases is stored on a portable device.
15. (Original) The system of Claim 8 wherein at least two of the databases have different record structures.
16. (Original) The system of Claim 8 wherein at least one of the plurality of databases is stored on a personal computer.
17. (Original) The system of Claim 10 wherein at least one communications link includes an API.
18. (Original) The system of Claim 10 wherein at least one communications link includes a wireless link.

19. (Original) The system of Claim 10 wherein at least one communications link includes the Internet.

20. (Original) The system of claim 10 wherein at least one communications link includes a serial connection and device specific APIs.

Claims 21-26. (Cancelled)

27. (Currently Amended) A computer program embodied on a computer-readable medium ~~storing executable instructions for use in~~ managing a plurality of calendar databases, ~~the program~~ comprising:

an interface to each of the plurality of databases adapted to obtain a subset of records from each of the plurality of databases, the subset of records spanning a date range; and

a user interface adapted to display a graphical representation of the obtained records, allow for interactive manipulation of the displayed graphical ~~representations~~ representation, and perform at least one database operation on at least one of the plurality of databases in response to the interactive ~~manipulations~~ manipulation.

28. (Current Amended) The computer program embodied on a computer-readable medium of Claim 27 wherein the user interface is adapted for synchronizing the plurality of calendar databases.

29. (Currently Amended) The computer program embodied on a computer-readable medium of claim 28 wherein the databases are reconciled without using an intermediate file.

Claims 30-33. (Cancelled)

34. (New) A method for reconciling data in a plurality of databases, comprising the steps of:

displaying a unique graphical representation of a record from each of a plurality of databases on a user interface;

interactively manipulating the unique graphical representation of at least one of the records from the plurality of databases on the user interface; and

performing a database operation on the record in the database in response to the interactive manipulation of the unique graphical representation of the record on the user interface.
